

ANOMY

Interdisciplinary Project Report (Draft)

Abstract

Anomy is a prototype college-only social media platform where only students with institutional email IDs can register. The platform supports posts, media sharing, comments, and community interaction while restricting outsider access.

Introduction

The goal is to provide a trusted campus network for communication, discussions, announcements, and media sharing. By limiting access to verified college users, the platform aims to reduce spam and improve authenticity.

Objectives

Provide secure authentication, enable posting of text/images/videos/links, support discussions through comments, encourage engagement using voting, and provide spam reporting.

System Design

Backend implemented using Node.js, Express and MongoDB. Passwords are hashed, JWT authentication protects APIs, and schemas store users, posts, and comments. Features include media uploads, voting, trending detection, and spam reporting.

Results

The prototype demonstrates authenticated access, content creation, comment threads, voting, spam reporting, and persistent storage using MongoDB.

Conclusion

Anomy shows the feasibility of a campus-exclusive social platform. Future enhancements can include college email verification, direct messaging, notifications, moderation dashboards, and scalable cloud storage.
